

RX-7 TWIN TURBO

CHASSIS & ENGINE GROUND UPGRADE KIT

The Pettit chassis & engine ground wire upgrade kit provides a proper ground path between the engine, chassis and battery. The integrity of the engine and chassis ground is essential for consistent, reliable operation of the many computer controlled systems in the 3G RX-7

To install the kit, locate the empty threaded hole forward of the driver's side front shock tower mounting (see figure below). Clean the surface around the hole with a piece of sandpaper until bare metal is exposed. Attach one end of the ground wire to the negative battery terminal. Attach the other end of the cable to the bared threaded hole with the bolt provided. Now locate the factory ground strap to the engine block. Locate the bracket on the engine that the strap is attached to. Disconnect the strap from the bracket and discard the stock bolt. Using the bolt provided, reattach the strap directly onto the engine block using the empty threaded hole located immediately below the original attachment point.
